

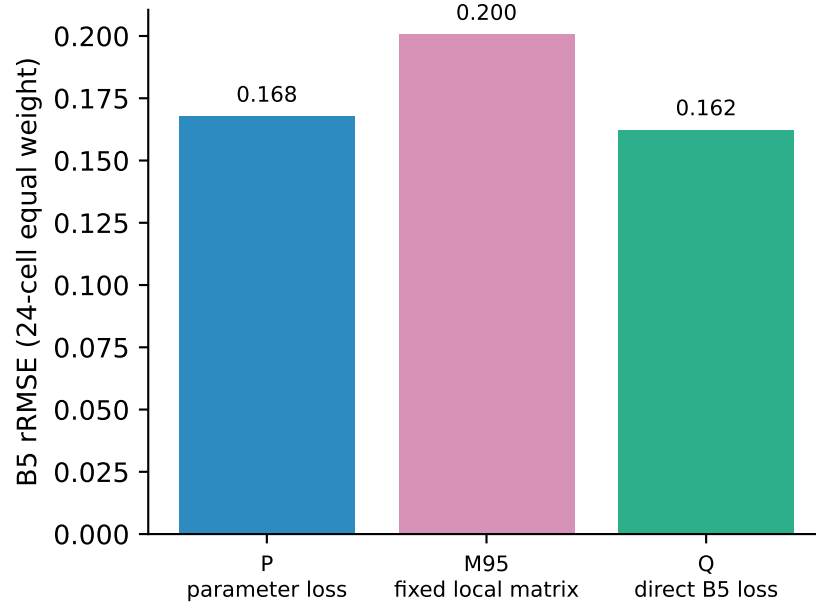

Fig 2 · Why direct target loss is not a fixed parameter weighting

(a) What changes during backpropagation

P_{equal}
 $\nabla_u L_P = 2u$
fixed normalized parameter-error rule

Q_{param}
 $\nabla_u L_Q = 2e(u)\nabla_u e(u)$
current B5 sensitivity is recalculated at each prediction

(b) A truth-point static matrix
does not replace Q

(c) The local rule improves, but what it misses
is larger
